

FirstRain Release Notes

Version 2021.13:

Feature Enhancement:

- **FRTRFeedGenerator replicate progress marking into database**

FRTRFeedGenerator currently stores the progress state (the minuteld of the last processed document) inside a progress file. Whenever a new processing round starts, the service will look into its progress marker file, and read the minuteld "x" of the last processed document. It will then probe the Solr core for documents whose minuteld is greater than "x" and send them to the customer. After finishing a processing round, the service will store the minuteld of the last processed document inside its process marker file.

If there is any issue such as manual deletions, file corruptions or permission issues will cause the service to fallback to minuteld 0 (causing it to go back to the beginning of the doc stream).
